ABOUT THE MANUAL

This manual contains the technical instructions for the control ESC08A.
All information given in this manual is current and valid according to the information available at the time of publication.
The data specified above only serve to describe the product. EBI Motion controls reserves to modify or revise the instructions without prior notice.

EBI Motion controls is not responsible for any damage caused by an incorrect use of the product.

INTRODUCTION

CONTROLS

EBC motion controls provides a broad choice of directional control valves expertly developed and tested to meet different market sectors' needs. EBC Control valves are suited for specialized applications for a variety of mobile equipment such as:

ECS08A

SECTIONAL DIRECTIONAL CONTROL VALVE

- From 1 to 12 working sections.
- Parallel and tandem circuit available.
- Low internal leakage.
- Compact directional valve with low pressure losses.
- Interchangeable spools.
- Wide range of auxiliary valves on the ports.
- Availability of manual, hydraulic, and electrohydraulic actuations.

GENERAL INFORMATION

HYDRAULIC OPERATING PRINCIPLE

Directional control valve ECS08A basically comprises of an inlet section, directional valve sections and an outlet section. It is designed to the 6-way principle and comprises of an arrangement body (1), control spool (3), load holding check valve (2), actuation spool (4), return action spool (5), cavities for the secondary pressure valves or relief/anti-cavitation valves (6), as well as anti-cavitation valves or plug (7).

With all of the spool axes in their neutral position the flow passes via the bypass channel at zero pressure to tank. If one of the control spools is actuated then the connection from the pump to the actuator is opened via the fine control grooves, whilst the bypass is throttled by fine control grooves. If the pump pressure exceeds the actuator pressure, the pressure fluid starts to flow over the check valve to the actuator.

With further movement of the control spool the volume of fluid is increasingly diverted from the bypass channel to the actuator (fine control). The spool stroke is divided into three phases: overlap (leak-free in the neutral position), fine control range (flow and pressure), residual stroke (fully open).

Due to the large fine control range of the spool stroke it is possible to sensitively control the actuators.

APPLICATION AND SAFETY GUIDELINES

INTENDED USE

Directional control valve ECS08A is designed for mobile applications.

WARRANTY

Check the package and the product for transport damage when receiving goods. The package is not meant for long term storage; protect the product appropriately. Do not dismantle the product. The warranty is void if the product has been disassembled. The manufacturer is not responsible for damages resulting from misinterpreted, non compliance, incorrect, or improper use of the product that goes against the instructions given in this document.

GENERAL SAFETY INSTRUCTIONS

The following instructions apply to all procedures associated with the product. Read these instructions carefully and follow them closely.

- Use necessary personal protective equipment when working with the product.
- Support the product properly; make sure the product cannot fall over or turn around by accident.
- Use only appropriate equipment and attachments for lifting and transferring the product.
- Prevent unintended use of the product during installation and maintenance procedures.
- Never use the Control Valve at a pressure exceeding the rated pressure.
- Use the Control Valve within the rated flow; if not there might be malfunction or a deterioration in heat balance.
- Using low-cleanliness hydraulic fluid might cause seal failure or damage to the seal part, resulting in operation failure, or operation mistake of the machine; the customer is requested to check the cleanliness of the hydraulic fluid.

WARNING SYMBOL

The following symbols can be used in this manual:

Note:
Useful
information

Danger:
Danger of death
or injury

Attention:
May cause damage
to the product

STORAGE OF NEW PRODUCT

Encapsulated by a protective wrapping, the control valve ECS08A shall not be exposed to direct sunlight nor to source of heat or ozone and kept in a dry place at a temperature between -20°C +50°C [-4°F +122°F].

Do not store the product in:

- Places where it might be damaged;
- Very hot/humid areas;
- Where it could get wet;
- Where it could come into contact with organic solvents, acids, alkalis and/or dangerous gases;
- In places subject to sudden, significant changes in temperature.

EBI motion control is not responsible for any damages due to a storage not in compliance with our prescriptions; For any doubts, please contact our aftersales office.

SAFETY GUIDELINES

During any operation on product ECS08A, it is recommended to pay attention to components surfaces temperature. The circuit functions are to be so designed that uncontrolled machine movements, caused by the application, are prevented and that it is possible to switch from one function to another. Take into account all of the application limits, particularly those application limits stated within this technical catalogue.

It is recommended to follow these steps and only trained and competent personnel may carry out any work on ECS08A Control Valve:

- Do not direct the jet of a pressure washing unit directly to the product
- Ensure that all matching surfaces are clean, without contamination.

- Ensure that all seals and back-up rings for the matching surfaces are flawless and correctly placed.
- Do not put any sealing material other than the standard seals.
- During the assembly of the complete Control Valve, refer to the hydraulic scheme and to the name assigned to each port.
- Use gloves in order to avoid accidental injuries during installation or maintenance.
- Do not grab / handle product from moving parts (i.e. cables, levers,...etc.)
- All Control Valve are attributable to pressure vessels. It's always recommended to place the components in a closed but ventilated compartment, able to protect the environment and users in case of accidental ejection of material under pressure (fittings, pipes, plugs, expander,...etc.)
- Before removing or disassembling the complete Control Valve or allowed parts (as pressure gauge ports, plugs) it is strongly recommended to vent all hydraulic pressure from the system.
- During the first start of the machine, please ensure that the grounding system is connected and stay away from moving parts.

HANDLING PRECAUTIONS

If the Control Valve doesn't work in the adequate way, we advise you to contact our aftersales Office. However if the disassembly and assembly operations are strictly unavoidable, you must observe the following prescriptions and charge the carrying out of the operations to technicians high qualified in hydraulic field.

- The Control Valve reaches high temperature after operating the machine; start the work only after checking that the temperature is low;
- The valve can hold high internal pressure; release the inside pressure and ensure all machine actuators are in a rest position before removing the piping. In any case safely and carefully unscrew connections and fittings.
- Since hydraulic devices are all machined precisely with very accurate clearances, carry out the disassembly adassembly work at a clean place;
- Before disassembly work, get the assembly instructions by requiring to our aftersales office and prepare all the material needed for the task;
- To disassemble and assemble the valve observe strictly our mounting instructions;
- Since there is the possibility of rust when the disassembled parts are left, apply anticorrosive oil to the parts and seal them;
- Before remounting the Control Valve on the operating machine, ensure that the Control Valve has not been affected by carrying out various hydraulic tests (e.g. Relief Valve setting, Leak test..).

Attention:

Always bear in mind that "all workers must act responsibly to ensure their own health and safety"; use of personal protection equipment is therefore essential. All the disassembly and assembly operations must observe strictly the procedures listed in the EBI procedures. EBI motion control is not responsible for any damages due to disassembly and assembly procedures not in compliance with our prescriptions. For any doubts, please contact our aftersales department.

INSTALLATION PROCEDURES

On receiving the Control Valve make sure you:

- Check if there are some sign of damage of the packaging;
- Check that the dimensions of the product seat are compatible with those of the product itself;
- Remove the plastic caps that protect the service ports and be careful not to introduce any dirt or foreign matters inside the control valve as this could damage it;
- Mount the control valve securely to a flat surface (recommended 3 point fixing); at the time do not use a hammer to positioning by hitting; any distortion in assembly can result in spool sticking and poor control;
- Clean piping materials sufficiently before use;
- Prevent the port openings from being entered with dust or foreign matters;
- tighten the port connectors surely with the recommended fastening torques;
- If possible, install the valve in a protected environment, avoiding direct exposure to weathering, water, salt or any other corrosion substances.

FITTINGS TIGHTENING TORQUE (Nm)

Do not tighten fittings with torque more than the recommended value; If not there might be strains or damage to Control Valve so as to cause a serious accident.

If the pipings are not connected to the correspondent ports, unintentional movements might cause a serious accident; EBI motion control is not responsible for any damages due to an installation procedure not in compliance with our procedures.

HYDRAULIC FLUID

Mineral oil based hydraulic fluids suitable for hydraulic systems can be used; they should have physical lubricating and chemical properties as specified by:

MINERAL OIL BASED HYDRAULIC FLUIDS HL (DIN 51524 part 1)

MINERAL OIL BASED HYDRAULIC FLUIDS HLP (DIN 51524 part 2)

For use of environmentally friendly fluids (vegetable or polyglycol base), or other fluids, please contact EBI.

OIL AND SOLUTIONS - ISO 6743/4	(°C) MIN	(°C) MAX
Mineral Oil HL, HM or HLP	-25	+80
Oil in water emulsion HFA	+5	+55
Oil in water emulsion HFB	+5	+55
Polyglycol-based aqueous solution HFC	-10	+60

Hydraulic fluids are available in different viscosity classes identified by the ISO VG number, which corresponds to the kinematic viscosity at 40°C. Here is a table showing typical viscosity changes between 0°C and 100°C for mineral oil based fluids having various viscosity classes. The fluid should be selected with the aim to achieve an appropriate operating viscosity at the expected working temperature.

VISCOSITY CLASS AND FILTRATION DATA			
Viscosity class	kinematic viscosity (cSt)		
	maximum (0° C)	medium (40° C)	minimum (100° C)

ISO VG 68	1400	68	7.8
ISO VG 100	2560	100	9.9

FLUID CLEANLINESS REQUIREMENTS

The cause of malfunctions in hydraulics is often found to be excessive fluid contamination. The hard contaminant particles in the fluid wear the hydraulic components and prevent the poppets from re-seating, with consequent internal leakage and system inefficiency. For the correct operation it is necessary to adopt filtration methods which guarantee for life the specified fluid cleanliness level. It is important to ensure that hydraulic fluids are brought to the appropriate cleanliness level prior filling up the systems, and, when in doubt, also to flush the hydraulic components prior to installation.

FILTRATION RATIO $BETA_x$:

It is the ratio between the number of particles before and after the filter with diameter larger than X micron.

ABSOLUTE FILTRATION RATIO ISO 4572:

It is the diameter X of the largest particle with $BETA_x \geq 75$.

CONTAMINATION CLASS ISO 4406:

It is expressed by 3 scale numbers representing respectively: the number of particles equal to or larger than 4µm, the number of particles equal to or larger than 6µm, the number of particles equal to or larger than 14µm contained in 1 ml of fluid.

CONTAMINATION CLASS NAS 1638:

It is expressed by one scale numbers representing the number of particles of different size ranges contained in 1 ml of fluid.

FILTRATION RECOMMENDATION				
Type	Nominal filtration (micron)	Absolute filtration rating ISO 4572 (BETA _{x≥75})	Contamination class	
			ISO 4406	NAS 1638
System/components operating at <i>MEDIUM HIGH PRESSURE</i> HIGH DUTY CYCLE APPLICATIONS Systems/components with MODERATELY dirt tolerance	15	X = 12... 15	20/18/15	9

Attention:

If the filtration demands are not met, the valve poppets can jam in the open position, with the result that the valve remains actuated. It is not possible to force back jammed poppets mechanically.

MATERIAL STANDARD SPECIFICATIONS SEALS

O-Rings: **Buna N** (acrylonitrile butadiene), also named **NBR** (according to ASTM), compatible with fluids having mineral oil base, water in oil emulsions, and water glycol fluids.

These seals are standard for temperatures within the range -20°C and +80°C

Back-up rings and Slide rings: **strengthened PTFE** (Politetrafluoroetilene like Teflon®, Lubriflon®, Ecoflon®, or similar). Special FPM (Viton®) seals are available on request.

Note: the seal materials are compatible with the fluids normally used in hydraulic systems; in case of special fluids, if you suspect incompatibility between the fluid used and the standard seals, contact the EBC motion controls service network.

CIRCUITS

PARALLEL CIRCUIT: a number of actuators can be operated simultaneously

Example:

When directional valves “a” and “b” are moved to position 2 (or 1), both actuators “a” and “b” are operated.

The division of flow to the individual actuators is dependent up on the working pressure of the actuator concerned.

TANDEM CIRCUIT: only one actuator may be operated.

Example:

When directional valves “a” and “b” are moved to position 2 (or 1), only actuator “a” is operated. Actuator “b” can only be operated, when spool “a” is returned to neutral.

(Exception: with a single acting spool, the lowering action of the cylinder is always possible).

ORDERING CODES

The order code below provides an example of control ECS08A with standard configuration.

This example represents a ECS08A with single electrohydraulic section.

You can configure a ECS08A up to 12 work sections; ordering code in position 6, 7, 8, 9, 10, 11, 12 and 13 must be repeated for every work section.

Note:

All sectional ECS08A valves have symmetric bodies; thanks to this characteristic, it is possible to change the control side, by simply reversing the spool 180°.
All valves can easily be changed from right inlet (R) to left inlet (L) and vice versa.
This example represents a valve in left configuration.

ASSEMBLY MODALITY FOR DIRECTIONAL CONTROL VALVE

Attention:

in the case of mixed configurations (section with electrohydraulic actuation and sections with mechanical or hydraulic actuation) it is mandatory to place all the electrohydraulic sections near to the outlet section. As a consequence all the mechanical or hydraulic sections will be positioned immediately after the inlet section.

EXAMPLE OF CONFIGURATION:

ECS08A/6 with 3 mechanical section and 3 electrohydraulic section: directional control valve with left inlet

Note:

All mixed configurations are assembly with outlet section with RDP valve. Assembly modality also applies to directional control valve with right inlet.

Note:

For mixed configurations different from example, please contact our Sales Office.

Tie rod kit allows the correct assembly of directional sectional valves ECS08A. Tie rod's length depends on the number of sections; each valve is assembled with tie rod kits including a tie rod, two nuts and two washer.

Two types of tie-rod kits are available:

- Assembly tie-rod for control valve with manual actuation
- assembly tie-rod for control valve with electrohydraulic actuation

INLET VALVE CLASSIFICATION

All inlet sections require double choice on side A and side B; in the following table the available valves are shown.

- Valve type V01 and V03 requires factory setting (V01150 - V03150); 150 is a value expressed in bar
- Valve type V04 includes coil kit
- 3 coil types are available in 12 and 24 Volt versions: DIN, DEUTSCH DT04 and AMP JUNIOR

ARRANGEMENT SECTION BODY

ECS08A arrangement section is available in two configurations: SAE thread or BSP thread.

Work section is available with parallel circuit or tandem circuit.

There are two types of arrangement section body:

- Body for electrohydraulic actuation
- Body for mechanical or hydraulic actuation.

Each arrangement section contains:

- Body
- Check valve
- Gasket kit.

The Gasket kit allows the correct coupling between the surfaces of the working sections. The gasket kit changes according to the type of the working section; the number and type of gaskets is different between a mechanically operated section and a section with an electrohydraulic control (see the following table).

GASKET KIT FOR ELECTROHYDRAULIC SECTION

GASKET KIT FOR MECHANICAL OR HYDRAULIC SECTION

Each work section can be ordered with or without auxiliary valves; in the following table the two different sections are shown.

JOYSTICK CONTROL ACTUATION

The Joystick option is made to control 2 spools at the same time with one hand. The way it can manage the flow is based on the fulcrum position so the code.

In the following table you can refer lever actuation against flow on valve ports (A/B).

Actuation code for spool without fulcrum is always **AJ00**

Note: Lever for joystick control (M10) has to be ordered separately.

DIRECT ELECTRIC CONTROL - PUSH PUSH ACTUATION

The electric control for the ECS08A is equipped with two push-push magnets operating the spool. The Push-Push actuation is suitable for all the mobile applications and, in particular, for agriculture machines and gardening machines. This type of actuation is also recommended for earth moving and lifting machinery applications and, in particular, truck mounted crane, forestry cranes and aerial platform stabilizers. It enables the use of remote-control systems.

The direct electric control needs a SE type special spool and special body.

ORDER CODE	DESCRIPTION
A01020002	Complete assembly kit PRV

OUTLET CLASSIFICATION FOR ELECTROHYDRAULIC CONFIGURATION (SIMPLE T PORT) WITH PRV AND BUILD-UP PRESSURE.

CODE	DESCRIPTION	CONFIGURATION
T3RC3S	Outlet T side A front - 7/8" 14 UNF (SAE10) with BUP <i>T2 drain: 9/16-18 UNF thread</i>	
T3RC3B	Outlet T side A front - G 1/2 with BUP <i>T2 drain: G 1/4" thread</i>	
T4RC3S	Outlet T side B rear - 7/8" 14 UNF (SAE10) with BUP <i>T2 drain: 9/16-18 UNF thread</i>	
T4RC3B	Outlet T side B rear - G 1/2 with BUP <i>T2 drain: G 1/4" thread</i>	

Note:

HPCO Outlet can not cope with BUP (Build-up pressure) valve.

OUTLET SECTION

OUTLET SECTION WITH ELECTROHYDRAULIC ACTUATION - INSTALLATION BUILD-UP PRESSURE VALVE

For those systems where the pressure at P port is lower than 9 bar, EBI can offer a build-up pressure valve into the Outlet manifold able to increase the pressure at the P port inlet accordingly.

ORDER CODE	DESCRIPTION	NOTE
A01020009	Complete Build up pressure valve	for outlet with SAE ports
A01020012		for outlet with BSP ports

OPTION

PAINTING

On request all ECS08A directional control valves by EBI can be delivered painted (RAL 9005 black primer).

SPARE PARTS LIST

Note:

This example represents a ECS08A with standard left configuration, with single electrohydraulic section. All sectional ECS08A valves have symmetric bodies, thanks to this characteristics, it is possible to change the control side, by simply reversing the spool 180°. All valves can easily be changed from right inlet (R) to left inlet (L) and vice versa.
